To Install Mission Controller To Kerbal Space Program.
1. Make sure all you Mission Controller contracts are DONE in Game!
2. First Delete any previous Mission Controller Folder Completely!
3. It's possible that in any update for mission controller you Saved contracts that have been finished might be wiped. I try to stop this from happening but sometimes its not possible. If this is an issue I suggest not installing Mission Controller.
4. Open up the Donwload zip file for mission controller.
5. Place the following 3 folders into your KerbalSpaceProgram/GameData folder
   a. MissionControllerEC (this contains the needed files for Mission Controller)
   b. CommunityResourcePack (this contains the resources Mission Controller Uses)
   c. CIT (This contains the EVA resource transfer Module needed to help transfer while In EVA)
6. Start up Kerbal Space Program!
7. Once you load your game Press ALT F12.
8. Once in the menu select contract tab.
9. Select the Tools Tab.
10. The press the Clear All Contracts to refresh all contracts in game and load any new values.\

If you fail to follow steps 5 through 9 it won't be the end of the world, but this is done to load up any new values that might be added to the contracts that was not available last version!

Kerbal Attachment system greatly increases the enjoyably of the repair contracts I highly suggest it!
